Question on Software or Operating system.

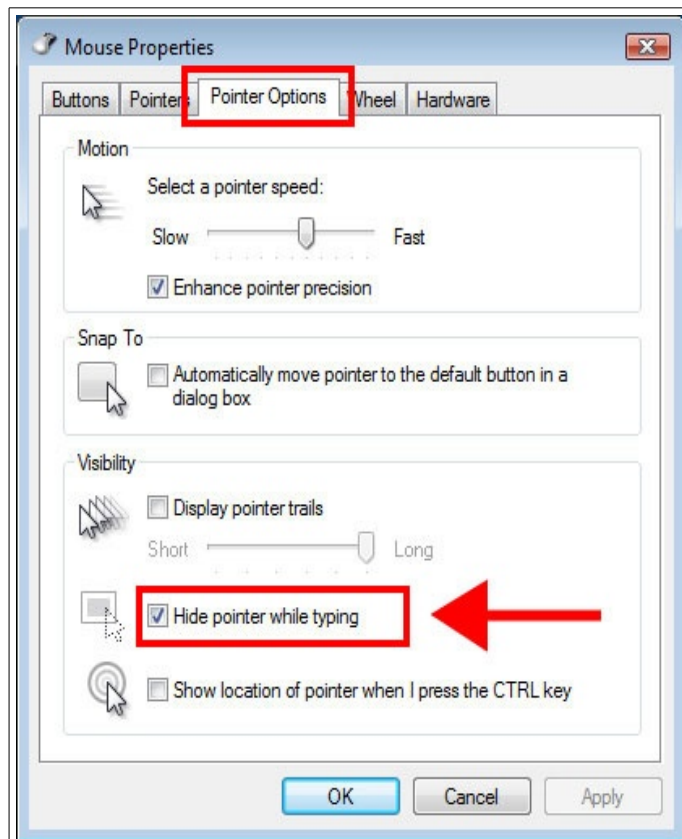

## Hide your Mouse Pointer

Does your mouse pointer get in the way while you're typing? Wish there was a way to just make it go away, then pop back up after the deluge of keystrokes subsides? Well, here is the solution.

For Windows XP:

- (1) Click **Start**
- (2) **Control Panel** and
- (3) Then double click **Mouse**.

In the Mouse Properties window, click on the [Pointer Options] tab and you will see a check box that says "**Hide Pointer While Typing**". Click the check mark in that box and click [Apply], then [OK].

For Windows Vista:

Much the same operation here. **Click Start>Control Panel>Mouse>Pointer Options**, The same check box is present so put a check in it click **Apply** and then **OK**.
